EXPERIMENT 6

Automating Business Processes Using Deluge Scripting and Workflows, with Application Testing and Debugging

Bank Loan Application Form — Workflow Automation Use Case

Submitted by

Mohid Ahmed F

Aim

To automate a key business process of the Bank Loan Application Form application — sending a loan application confirmation email the moment an applicant submits the loan application form — using a Zoho Creator workflow and a Deluge script, and to test and debug the automation end-to-end with real form submissions.

This removes the need for bank staff to manually notify every applicant, ensuring each submitted loan application is acknowledged immediately and consistently.

Procedure

1. **Start a new workflow** — From the application's Workflow section, a new workflow was created on the loan application form.
2. **Define the trigger** — The Record Event was set to Created and the Form Event (When to trigger workflow) was set to Successful form submission, so the automation fires only after a valid, saved submission.
3. **Name the workflow** — The workflow was named on successful form submission and saved using Create Workflow.
4. **Add a new action** — In the Add New Action dialog, Deluge script was chosen as the Action type so custom logic could compose and send the email.
5. **Write the Deluge script** — The form inputs Email, Name, Loan_type, Preferred_Disbursement_Date and Preferred_Contact_Time were first stored in the variables applicant_email, applicant_name, loan_type, disbursement_date and contact_time (the date and time converted with toString()). A sendmail script then sets from to zoho.adminuserid, to to applicant_email, builds a Subject of “Loan Application Submitted”, and concatenates a message with the applicant's name, loan type, preferred disbursement date and preferred contact time.
6. **Save the action** — The script was saved so that it executes automatically under loan application › Created › Successful form submission.
7. **Test with a live submission** — The loan application form was opened in the live application and filled in through its Applicant Details and Contact Details sections — Loan Type: Home Loan, Preferred Disbursement Date: 29-Oct-2026 — and submitted to trigger the workflow.
8. **Debug and verify the output** — The applicant's inbox was checked immediately after submission to confirm the automation ran correctly: the confirmation email arrived with the correct dynamic values (name, loan type, disbursement date and contact time), confirming the Deluge script executed without errors.

Output

1. Creating the Workflow — Trigger Configuration

The new-workflow screen shows the form set to loan application, the Record Event set to Created, and the Form Event set to Successful form submission, with the workflow named on successful form submission. This defines exactly when the automation should run.

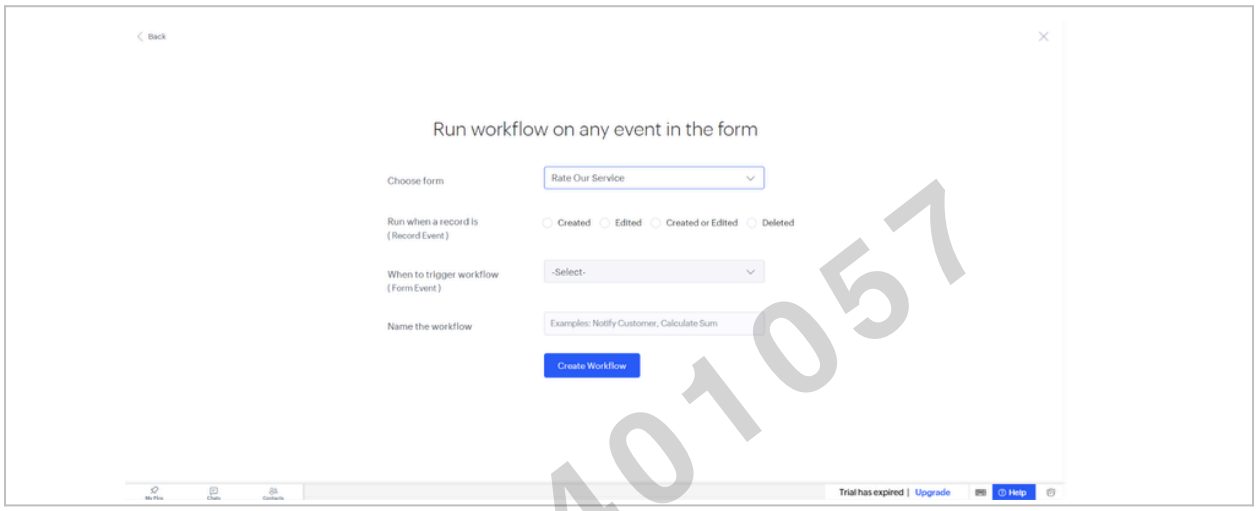

Fig. 1 — Workflow: trigger configuration on successful form submission

2. Writing the Deluge Script

The Deluge editor shows the completed script. It reads the form fields Email, Name, Loan_type, Preferred_Disbursement_Date and Preferred_Contact_Time into variables, then uses sendmail to build the subject and message dynamically and send them to applicant_email.

3. Testing — Submitting a Live Record

A real loan application record was filled in and submitted through the live form (Applicant Details, Contact Details, Loan Type: Home Loan, Preferred Disbursement Date 29-Oct-2026) specifically to trigger the on successful form submission workflow and observe its behaviour.

Final Result

A complete workflow was built on the loan application form that fires automatically on successful submission, using a Deluge sendmail script to generate a personalised confirmation email with no manual intervention from the bank staff.

The automation was tested with a live form submission and debugged by inspecting the resulting email: all dynamic fields rendered correctly, confirming the script's field references and string concatenation were error-free.

The exercise met its objective: a real business process — notifying applicants that their loan application was received — is now fully automated through low-code workflow and Deluge scripting, and the testing step confirmed the automation behaves reliably end-to-end.
